(57) Abstract:

PURPOSE: To easily registration-release all registration subscribers at one terminal.

CONSTITUTION: When a subscriber 2_i executes a registration operation on a terminal 1_i, the identifier SID_i and the identifier PID_i of the subscriber 2_i are transmitted from the terminal 1_i to an exchange 4 as a registration request. The exchange 4 registers SID_i in the area of PID_i in a subscriber data base 3, and registers PID_i in the area of SID_i in a terminal data base 5. When the terminal 1_i releases the registration subscriber, the SID_i and release are noticed to the exchange 4. The exchange 4 reads and erases all the subscriber identifiers of the area of SID_i in the terminal data base 5 by SID_i, transmits all the subscriber identifiers to the subscriber data base 3 and erases respective SID_i of the area of the subscriber identifiers.
